

Pink Fairy Baby's Breath
Gypsophila paniculata 'Pink Fairy'

Height: 18 inches

Spread: 24 inches

Sunlight: ☉

Hardiness Zone: 2a

Other Names: Common Baby's Breath

Ornamental Features

Pink Fairy Baby's Breath features airy plumes of shell pink flowers at the ends of the stems from mid summer to early fall. The flowers are excellent for cutting. Its grassy leaves remain silvery blue in colour throughout the season. The fruit is not ornamentally significant.

Landscape Attributes

Pink Fairy Baby's Breath is a dense herbaceous perennial with a mounded form. It brings an extremely fine and delicate texture to the garden composition and should be used to full effect.

This plant will require occasional maintenance and upkeep, and is best cleaned up in early spring before it resumes active growth for the season. Gardeners should be aware of the following characteristic(s) that may warrant special consideration;

- Spreading

Pink Fairy Baby's Breath is recommended for the following landscape applications;

- Mass Planting
- Border Edging
- General Garden Use
- Naturalizing And Woodland Gardens

Planting & Growing

Pink Fairy Baby's Breath will grow to be about 18 inches tall at maturity, with a spread of 24 inches. Its foliage tends to remain dense right to the ground, not requiring facer plants in front. It grows at a fast rate, and under ideal conditions can be expected to live for approximately 10 years.

This plant should only be grown in full sunlight. It prefers dry to average moisture levels with very well-drained soil, and will often die in standing water. It is considered to be drought-tolerant, and thus makes an ideal choice for a low-water garden or xeriscape application. It is not particular as to soil type, but has a definite preference for alkaline soils, and is able to handle environmental salt. It is highly tolerant of urban pollution and will even thrive in inner city environments. This is a selected variety of a species not originally from North America.
