

Pembina Plum
Prunus 'Pembina'

Height: 18 feet

Spread: 14 feet

Sunlight: ○

Hardiness Zone: 3a

Description:

A popular hardy fruit tree with showy fragrant white flowers in spring and purple-red fruit in late summer, great for eating fresh and cooking; open and wide spreading, ideal for the home orchard; recommended pollinators are Brookred Plum and Toka Plum.

Edible Qualities

Pembina Plum is a small tree that is commonly grown for its edible qualities. It produces red round fruit (technically 'drupes') with yellow flesh which are usually ready for picking in late summer. Note that the fruits have hard inedible pits inside which must be removed before eating or processing. The fruits have a sweet taste and a juicy texture.

The fruit are most often used in the following ways:

- Fresh Eating
- Cooking
- Preserves
- Drying
- Canning

Features & Attributes

Pembina Plum is covered in stunning clusters of fragrant white flowers along the branches in early spring before the leaves. It has forest green deciduous foliage. The pointy leaves turn yellow in fall. The fruits are showy red drupes carried in abundance in late summer. The fruit can be messy if allowed to drop on the lawn or walkways, and may require occasional clean-up.

This is a deciduous tree with a more or less rounded form. Its average texture blends into the landscape, but can be balanced by one or two finer or coarser trees or shrubs for an effective composition. This plant will require occasional maintenance and upkeep, and is best pruned in late winter once the threat of extreme cold has passed. It has no significant negative characteristics.

Aside from its primary use as an edible, Pembina Plum is suitable for the following landscape applications;

- Accent
- Orchard/Edible Landscaping

Planting & Growing

Pembina Plum will grow to be about 18 feet tall at maturity, with a spread of 14 feet. It has a low canopy with a typical clearance of 4 feet from the ground, and is suitable for planting under power lines. It grows at a medium rate, and under ideal conditions can be expected to live for 40 years or more. This variety requires a different selection of the same species growing nearby in order to set fruit.

This tree is typically grown in a designated area of the yard because of its mature size and spread. It should only be grown in full sunlight. It does best in average to evenly moist conditions, but will not tolerate standing water. It is not particular as to soil type or pH. It is highly tolerant of urban pollution and will even thrive in inner city environments. This particular variety is an interspecific hybrid.
